

TRADEPULSE

3-Minute One-Speaker Pitch Script

Track 1 - Agentic AI | Cross-border trade finance / GIFT IFSC

Item	Detail
Speaker	1 member only (platform/demo or product narrative - one voice)
Length	<= 180 seconds (~420-450 words at calm pace)
Live proof	http://tradepulse-web-80820411.ap-south-1.elb.amazonaws.com
Method	YC-style: what -> problem -> failure -> mechanism -> why now -> proof -> team -> ask
Rubric focus	Live tech 25% Innovation 20% Problem/Market/Demo 15% each Team R1 10%

Delivery rules (founder playbook)

- **Clarity over flair** - one sentence = one idea. No "AI will revolutionize."
- **Lead with the non-obvious insight** - AI that refuses false certainty beats AI that rubber-stamps.
- **Name the buyer** - "Head of Trade Finance Ops at a GIFT City IBU," not "banks and fintechs."
- **Prototype != product** - say it once, out loud. Judges hunt for this.
- **Practice with a phone timer**. Pause after the one-liner and after "never PASS."
- **Demo**: Pre-open a completed case. Do not create a fresh case live unless pre-warmed.

SCRIPT - speak this

[0:00-0:15] Hook + what we are

Hi - we're **TradePulse**.

We build **documentary trade-compliance decision support** for the person who actually owns the exception queue: the **Head of Trade Finance Operations at a GIFT City IBU** - and the examiners on their desk.

We do **not** approve trades. We do **not** clear Customs. We make the documentary pack **defensible** - faster.

[0:15-0:50] Problem + why current tools fail

Cross-border trade still runs on PDFs: commercial invoice, bill of lading, party names, amounts, routes.

Today that work is either **manual UCP-style grind**, or "AI checkers" that treat a **fuzzy name hit as identity** and quietly skip missing data as if it were a green pass.

That creates two failures banks cannot afford: **false certainty** in audit - or **endless exceptions** that kill turnaround.

GIFT IFSC is scaling trade finance through IBUs - IFSCA has been enabling trade credit, factoring, forfaiting; IBU trade-finance outstanding is on the order of **tens of billions of USD**. Volume is rising. Scrutiny is not going away.

[0:50-1:35] Solution + why now + differentiation

TradePulse is an agentic examiner workbench.

Documents go through a **bounded swarm**: extract -> validate -> challenge -> arbitrate - **maximum three rounds**. Every correction must cite evidence. If agents disagree, we return **REVIEW_REQUIRED**. We never average conflicting values.

On identity we use a **confidence ladder**: a GLEIF name candidate is **not** proof; an LEI on the document is stronger; **vLEI is separate** - and a fixture credential is labeled synthetic, never sold as live verification.

Missing source data stays **DATA_UNAVAILABLE**. It **cannot become PASS**.

Why now: agentic model costs finally make multi-step debate affordable; LEI/vLEI rails are maturing; and **IFSCA's GIFT trade-finance posture** means IBUs need audit-grade speed without autopilot risk.

That's our innovation - not "more agents." **Epistemic honesty baked into the product**.

[1:35-2:20] Proof (say "working live")

This is not a slideware prototype.

Working live on AWS - Mumbai region: Next.js workbench and FastAPI on **ECS Fargate behind load balancers**, documents in **S3**, OCR via **Textract**, agents on **Bedrock**, typed contracts end-to-end.

In the product you'll see: case create -> upload invoice and transport docs -> processing rail -> workbench with identity ladder -> **download examiner case pack** for maker-checker handoff.

What we shipped tonight is a **proof point**: the trust core + live path. It is **not** the finished bank product - and we know the difference.

[2:20-2:45] First customer + how we get there

First paying customer, specifically: Head of Trade Finance Ops at a **GIFT City IBU** (or a mid-size private-bank trade desk with IFSC corridor volume).

How we get to them: residency and mentor intros here -> one corridor pilot -> success metric is **fewer unexplained exceptions** and **complete examiner packs** - not an "AI approval rate." Champion is Ops; Compliance is the gate we design for by staying decision-support-only.

[2:45-3:00] Team + ask

Team: platform and AWS contracts; workbench product; UI quality; QA release gate - named owners, not "everyone codes everything." We stop when PRD and contracts conflict instead of inventing truth mid-demo.

Ask: Young Builders / GIFT IFIH for **pilot pathway, regulatory guidance, and IBU introductions** - so Monday we harden the trust core for a supervised bank pilot, not a louder pitch deck.

TradePulse: **examiner decision support. Live. Honest. Built for GIFT trade ops.** Thank you - happy to take questions.

Word count: spoken body ~430 words -> ~2:50-3:00 at 145 wpm. If fast, pause 2s after "never PASS" and "proof point."

Optional on-screen prompts (do not read)

Time	On screen (max ~6 words)
0:00	TradePulse · Decision support
0:20	False certainty kills audits
0:50	Bounded agents · Identity ladder
1:35	Live on AWS · Examiner pack
2:20	Buyer: GIFT IBU Trade Ops
2:45	Prototype != product · Ask

Pre-loaded answers - Judges' 3 questions (Q&A; only)

1) Who is your first paying customer, specifically, and how do you get to them?

Head of Trade Finance Operations at a GIFT City IBU. Path: IFIH/mentor intro -> 4-6 week supervised pilot on invoice + BoL for one corridor. We sell exception reduction and audit-ready examiner packs, not autopilot approval. Economic buyer is Ops; Compliance signs the decision-support framing.

2) What would break first if you sold this to a real bank/NBFC next week?

Enterprise SSO, private VPC networking, model-risk review of prompts, and live sanctions/list contracts - not the happy-path demo. Synchronous Textract + Bedrock latency would also fail SLA. Sell a supervised pilot with labeled adapters and HITL policy - not production autopilot.

3) If you started Monday, what would you build first - and is it what you built tonight?

Monday #1: trust core - identity ladder, failure states that never false-PASS, examiner pack, async job queue, SSO. Tonight is the agentic + live AWS proof point. Same spine - different completeness. Prototype != product.

30-second emergency cut

We're TradePulse - decision support for Head of Trade Finance Ops at a GIFT City IBU. Banks drown in PDFs; AI checkers create false certainty. We run bounded agents, an identity ladder, and never turn missing data into PASS. Working live on AWS with an examiner pack for maker-checker. Tonight is a proof point, not the finished bank product. We want GIFT pilots and IBU intros. Thank you.

(~95 words ~ 35-40s - only if forced)

Rehearsal checklist

- Timer hits <= 2:55 with natural pauses

- Said "Head of Trade Finance Ops at a GIFT City IBU" once
- Said "decision support" / "not approve" once
- Said "working live" / AWS once
- Said "prototype is a proof point" once
- Did not claim Customs clearance, physical container check, or "AI sanctioned"
- Demo tab pre-loaded on a finished case
- Teammates silent unless Q&A; hands off

Framing: YC short-pitch clarity; Demo Day 3-min structure; IFSCA/GIFT trade-finance context; Young Builders scoring + Judges' Q&A; guidebook.
